IPC-Tags
BARCODE LABELS FOR TEXTILES

Solutions for 'Difficult to Track' Inventory Items

Labeling Solutions for Non-Fabric Items

IPC-Tags recommends our durable matte or gloss peel & stick barcode or QR code labels for items such as belts, shoes, handbags, hats, masks, furniture, lighting, luggage, and other props.

Some ideas . . .
Jewelry – Jewelry items can be tracked by storing in a plastic bag, placing a barcode label or QR code label on the outside of a plastic bag. Additionally, inserting a photograph of the item inside the plastic bag helps to quickly identify the item when it is time to return the item to the bag.

Shoes & Handbags – A peel & stick label should be placed on the arch area of the shoe when possible. Handbags might have a lining that can be separated from the handbag material, allowing a heat seal label to be applied. A peel & stick label can also be used.

Belts – The peel & stick label is typically placed on the inside near the belt buckle.

Labeling Solutions for Fabric or Textile Items . . . that might be too delicate to apply a heat seal label

Some delicate fabrics cannot tolerate a high temperature heat seal application or the design of the apparel limits the placement of the garment onto the heat seal machine platen. IPC-Tags recommends applying the heat seal label or heat transfer label to a separate piece of fabric and then sewing that piece of fabric to the apparel.

Consistent placement of the label within an item group will reduce scanning time in and out of your facility. IPC-Tags will provide free label samples for customer onsite testing of label suitability in your environment.
