

Use a laptop or desktop computer for the Prepared Software.

Using the cellphone camera to scan the QR Code labels with the Prepared Mobile Computing App simplifies adding inventory items.

Choose a heat seal machine for applying heat seal labels and heat transfer labels to fabrics. Ensure settings are available for the appropriate time, temperature and pressure for proper label application. An automatic pop-up heat press is best.

For fabric items, heat seal or heat transfer labels can be permanently applied directly to the apparel piece.

For non-fabric items, use a poly peel & stick label with an aggressive adhesive.

Congratulations!

You now have the components to begin applying QR Code labels to your apparel, linens, textile items and tracking your inventory in the Prepared App.

For more information on application, heat seal machine settings, trouble-shooting please see the webpage for Prepared Customers.
